Team Contribution

Team Members

1. Shakar Vara Prasad Neelapala

2. Ramya Sada

3. Gagan Vaishnav Tej Vegireddy

4. Likhita Sai Yandamuri

This project was developed using a fully collaborative team model, where all four team members contributed equally across all areas of the framework, including UI automation, API automation, hybrid integration, framework design, execution, debugging, and documentation.

There were no fixed ownerships or isolated responsibilities. Instead, the team followed a shared responsibility approach, ensuring that every member gained complete understanding and hands-on experience with the entire system.

Collaborative Working Approach

The team adopted the following working strategy:

- All modules (UI, API, Common, and Integration) were designed and implemented collectively.
- Tasks were discussed as a group and distributed dynamically based on availability and complexity.
- Pair programming and peer reviews were used to ensure knowledge sharing.
- All team members participated in:
    - Writing test cases
    - Developing automation scripts
    - Debugging failures
    - Enhancing framework utilities
    - Validating execution results

- Regular discussions ensured consistency in coding standards and framework design.

Contributions Across Modules

1. UI Automation (Selenium + Cucumber)

All team members contributed to:

- Designing Page Object Model (POM)
- Creating feature files and step definitions
- Automating test cases:
    - User Registration
    - Login (valid & invalid)
    - Add to Cart
    - Remove from Cart
- Implementing waits, locators, and reusable UI methods
- Handling screenshots on failure

2. API Automation (Rest Assured)

All team members contributed to:

- Designing layered API architecture (Client → Request Builder → Validator)
- Automating API test cases:
    - Get all products
    - Search product
    - Create user
    - Update user
    - Delete user
    - Negative scenarios
- Implementing request building and response validation
- Performing JSON schema validation

3. Common Module (Shared Utilities)

All team members contributed to:

- Configuration management (no hardcoding)
- Utility classes (ConfigReader, constants, helpers)
- Logging setup using Log4j
- Reusable methods for both UI and API modules
- Test data handling and dynamic data generation

4. Hybrid Integration (UI + API)

All team members contributed to:

- Integrating API and UI layers
- Using API-generated data in UI flows
- Validating end-to-end scenarios across layers
- Ensuring seamless data sharing between modules

5. Execution, Reporting, and Debugging

All team members contributed to:

- Configuring TestNG runner with Cucumber
- Enabling parallel test execution
- Generating reports (Allure/other tools)
- Capturing screenshots for failures
- Analyzing logs and fixing issues
- Validating final test execution results

6. Version Control and Collaboration (Git)

All team members contributed to:

- Creating branches and managing code
- Performing commits, pull, push, and merge operations
- Resolving conflicts collaboratively
- Maintaining clean and structured repository

7. Documentation

All team members contributed to:

- Writing README file
- Preparing architecture documentation
- Creating flow diagrams
- Documenting framework structure and execution steps
- Final review and refinement of deliverables

Team Collaboration Highlights

- Strong team coordination and communication
- Continuous peer learning and support
- Equal participation in development, testing, and validation
- Focus on code quality, reusability, and scalability
- Collective ownership of both success and issues

Conclusion

This project reflects a true team effort, where all members worked collaboratively without fixed roles. The shared contribution model ensured that every individual was involved in all aspects of the framework, resulting in a well-integrated, high-quality hybrid automation solution.
